Design process

- I wanted to show a overview of the Safety index of all available countries
- Secondly, I wanted to show if there is a correlation between the Safety Index and the Purchasing Power Index, to see whether income would influence safety
- In order to do this, a map of the world and a scatterplot would be the right choices to represent the data.
- Furthermore, I wanted to show the development of Safety Index and the Purchasing index overtime. To that end, I created an update button. When clicked
- Since I am a fan of quick and clear overview of data, I decided to stick to one page when representing the data.
- In line with this philosophy, I decided to make both visualizations next to each other, instead of underneath.
- The legend and axis labels are put in empty space, so they would not interfere with the visualizations.
